Yes, Cats Can Get Sunburned.

HERE'S WHAT MOST CAT PARENTS DON'T HEAR IN TIME.

Most cat parents assume kitty's fur is protection enough. It isn't — not in the spots that matter most.

Yes, cats can get sunburned.

The at-risk areas are the ones we check least: the **tips of the ears**, the **nose**, and the **belly** when they roll over in a sunny spot.

White, cream, and thin-coated cats burn fastest — but any cat with pale skin under the fur is at risk.

WHY IT'S WORTH KNOWING

Sunburn in cats isn't just discomfort. Repeated burns to the ears and nose are a leading cause of **squamous cell carcinoma** — the most common cancer of the cat ear and nose.

Caught early, it's treatable.

Avoided entirely, it's preventable.

(One quick note: short bursts of active window enrichment — like bird-feeder time — aren't the issue. It's hours of unsupervised midday sunbathing on a south-facing window that's the risk.)

THE 3 THINGS TO DO THIS WEEK

Check kitty's ears and nose during your next grooming session watch for redness, flaking, or crusty patches.

During peak sun hours (10am–4pm), limit kitty's longest sunbathing sessions or add UV-blocking window film to south-facing windows.

Give kitty a cozy alternative for those long midday hours somewhere they'll actually choose.

*(Our **Fluffy Cat Bed** is the one that tends to get claimed — cat-tested, cat-approved, \$49.99 from \$99.98.)*
